Another plane crashed in Helligvær during the war. It crashed into the sea in Lyngvær, in the far north-east of the archipelago. Most likely the pilot died.

In 1975, people from the diving club Sjøstjerna were out in Helligvær diving. They picked up lost anchors and checked moorings, among other things. They had their base at the old school on Vokkøya. One of the local fishermen on the island, Olaus Olaussen, tipped them off about a possible plane wreck in Lyngvær. How he knew about I don't know.

A team went out to the designated position in the motorboat belonging to Berner Skogsholm. Jan Petter Krogh and Sigbjørn Skogsholm, the son of the owner of the boat, made a dive and found wreck at approx. 38 meters deep. Sigbjørn dived with borrowed equipment. The wreck lay on

white sand between two reefs, exposed and unprotected, the nose pointing to the south. They did not see nationality or type, except that the aircraft was single engine.

The engine appeared to be an in-line engine and was still fixed to the wreck.

The covering on the hull was mostly gone, only the skeleton remained. After a

short while they decided to ascend. The reason was primarily that they were surrounded by a large shoal of curious catfish.

This has been the only search for the plane that I know about.
